

Aim

To understand and implement functions in Kotlin by defining functions with parameters, return types, and calling them to display output in an Android application.

Procedure

- 1 Open Android Studio.
 - . Open your project.
- 2 Go to:
res → layout → activity_main.xml .
- 4 Add a **TextView** to display output.
- 3 Open MainActivity.kt and:
 - 5 o Define functions inside the class.
 - . o Call those functions inside onCreate().
 - o Display results using TextView.
- 6 Run the application on emulator/device.
 - . Observe the output.
- 7

Code**activity_main.xml**

```
<?xml version="1.0" encoding="utf-8"?>
<LinearLayout xmlns:android="http://schemas.android.com/apk/res/android"

    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:gravity="center"
    android:orientation="vertical">

    <TextView android:id="@+id/txtOutput"
        android:layout_width="wrap_content"
        android:layout_height="wrap_content"
        android:textSize="20sp"/>
</LinearLayout>
```

MainActivity.kt package

com.example.kotlinbasics

```
import android.os.Bundle import
android.widget.TextView import
androidx.appcompat.app.AppCompatActivity class
MainActivity : AppCompatActivity() {

    // Function with parameters and return type
    fun add(a: Int, b: Int): Int {
        return a + b
    }

    // Function with parameter and return type
    fun greet(name: String): String {
        return "Hello, $name"
    }

    // Function without parameters fun
    welcomeMessage(): String {
        return "Welcome to Kotlin Functions"
    }

    override fun onCreate(savedInstanceState: Bundle?) {
        super.onCreate(savedInstanceState)

        setContentView(R.layout.activity_main) val txt =
        findViewById<TextView>(R.id.txtOutput)

        val result1 = add(10, 20) val
        result2 = greet("Ravi") val
        result3 = welcomeMessage()

        txt.text = "$result3\n$result2\nSum = $result1"
    }
}
```

Result

The application successfully demonstrates function usage and displays:
